

INSTRUCTION MANUAL

GHD-22
Geared Head Drill (415V)
31.5mm Drilling Capacity 3MT

D170

Instruction and Spare Parts List

This is your copy of the instructions and spare parts list for Drilling Machine. It has been prepared for those using the machine or who are responsible for its maintenance and service and should therefore be made readily available for all those concerned.

Read through the manual carefully before installing and starting up. The machine is of simple design and robustly built, but we cannot guarantee perfect function if it is incorrectly handled.

It is therefore necessary to make yourself thoroughly acquainted with the function and to carry out practical tests on the various parts in the control system and the machine settings. Once these are mastered the excellent properties of the machine can be fully utilized and the component parts will give maximum service life.

Every machine is tested for accuracy and capacity at the factory. Experienced staff check both the mechanical and electrical functions according to a standardized programme, meaning that we can guarantee workmanship of the highest and most consistent quality.

By following our directions and you own good judgement we are convinced that your new machine will give every satisfaction. However, should any problems arise, please do not hesitate to contact our dealer or us.

Safety regulations

Used correctly your machine is one of the best concerning design and safety. However, any machine which is used incorrectly can be a safety risk. It is of vital importance, that those who use the machine are informed how to handle it correctly. They should read and understand these instructions as well as all plates available on the machine. Omitment to follow the safety regulations might cause an accident.

Warning

- Using the machine incorrectly can cause serious accidents.
- The machine has to be installed, used and maintained correctly.

General safety regulations

All machines with rotating tools or details can cause accidents. It is therefore important that you as an operator are aware of those risks for any accident and that you avoid all possibilities for accidents.

- Always use such clothes and personal equipment so you cannot get caught by rotating tools.
- Always use protective goggles if there exist a risk for chips or splashes from the coolant. Follow local instructions if existing.
- Keep it clean around the machine to avoid to stumble against rotating tools.
- See to it that the work piece is securely fastened at the table. Never use your hand to hold the work piece.
- See to it that the switch is in the 0 position when changing tools or when cleaning the machine.
- Never brush away chips while the machine is operating.
- Use faultless tools and the correct speed and feed for the tool. Be sure that the tool is the correct one for your operation.
- See to it that the drill head and the table are thoroughly damped before starting up the machine.

Installation

- Avoid to install the machine in a humid, dirty or badly illuminated environment.
- Be sure that the machine possesses all necessary protections.
- Electric installations have to be executed by a qualified electrician.
- Be sure that the machine is steadily put up and positioned.

Using

- Never use the machine if it lacks necessary protections.
- Follow applicable regulations for use of machine regarding, personal protective equipment.
- Do not operate the machine with loose clothes or juwelleries. Use hair-net if necessary.
- Never stretch yourself over the machine when it is running.
- Never leave the machine when running.
- Always stop the machine when not in use.

By service and maintenance

- See to it that the current is disconnected.
- Always follow the instructions in this manual.
- Do not modify the machine without contacting our dealer.

Cleaning:

All bright parts of the machine are treated with rust preventive. By removing this, be careful not to use too strong cleaning compound. The paint might then get damaged.

Installation:

The machine must be installed on a firm foundation.

The baseplate must be levelled with washers on the foundation bolts to prevent harmful stresses when the nuts are tightened.

Lubrication:

All high-speed shafts and gears are journalled in ball bearings or roller bearings, so that the machine needs very little lubrication.

THE GEAR HOUSING MUST NOT BE FILLED WITH OIL.

EXCESSIVE LUBRICATION SHOULD BE AVOIDED, AS EXCESS OIL CAN DROP INTO THE MOTOR AND DAMAGE ITS INSULATION.

Connections to mains:

The connection to be effected direct to the thermal overload circuit breaker or on multisindle machines to a junction box common for all drilling heads.

Note the earth screw!

(See attached wiring diagram.)

Spindle speed selection:

The selection of the different spindle speeds according to the plate on the front of the drive gear box is effected by the levers on the left hand side of the gear box and also by means of the pole change switch for the motor.

General:

IT SHOULD BE NORMAL PRACTICE TO DISCONNECT THE MACHINE FROM THE MAINS BEFORE ANY DISAMANTLING TAKES PLACE. ON RE-ASSEMBLY SEE TO IT THAT ALL SURFACES ARE CLEAN AND THAT ANY BURRS WHICH MAY HAVE BEEN MADE DURING DISASSEMBLY ARE FIRST REMOVED.

Drive gear box:

When it is necessary to disassemble the drive gear box:

Remove the four screws which connect the drive gear box to the quill housing. Then take away the fan cover and the fan from the quill housing. By knocking slightly on the rotor shaft the drive gear box can be removed. The gear box casting, consisting of two halves can be taken apart by loosening the four screws. All shafts can now be taken out for further disassembling.

When re-assembling the drive gear box, check that the shift pin fits properly into the groove of the clutch. When re-placing the drive gear box on the quill housing, it must be checked that the driving keys in the spindle are in place and that they will fit properly the corresponding key ways on the gear box output shaft.

Spindle:

The spindle is journaled in the quill by a taper roller bearing at the bottom and by a radial ball bearing at the top. At the top end of the spindle there is a nut with which the play in the taper bearing can be adjusted. This nut can be reached, when the quill is removed from the machine.

Hold the spring housing by co-locating a hex key in the centre of the housing and loosen the screw. Let the housing to relieve the pressure on the spring. The quill will then automatically go to its lowest position.

Remove the stop and loosen the screw, which keeps the feed shaft in its position. Hold the quill with one hand and push the feed drive shaft so far to the right to disengage the teeth from the quill feed rack. Then remove the quill.

When re-assembling, the keys on the spindle are to coincide with the key ways in the spindle shaft. Take care to avoid damaging the keys when sliding the quill into position.

Counter balancing:

The spring housing for counter balancing of the spindle is removed as follow:

Hold the spring housing with a hex key and at the same time loosen the locking screw which secures it. Let the housing turn in order to relieve the pressure on the spring, then turn the spring housing round in a clockwise direction, so that the spring will be released from the screw, with which it is fixed to the feed shaft. The spring housing can now be removed.

When re-assembling press the spring housing with the spring into its place and turn in counter-clockwise direction until the spring fits to the screw on the feed shaft.

Then turn the spring housing further in counter clockwise direction, until the correct balancing of the spindle is obtained. Then lock the housing with the screw.

Motor:

If it is necessary to remove the stator, proceed as follow:

DISCONNECT THE MACHINE FROM THE MAINS.

Remove the drive gear box, the quill and the feed drive shaft as indicated above. The motor and the line cables are removed from the pole-change switch. Secure the quill housing with a lifting band. Loosen the screw and lift off the quill housing. Then remove the elevating mechanism for the drilling head.

The two step screws on the left side of the quill housing keeping the stator in its position, are removed and the position of the stator is marked in the housing. By knocking lightly on the underside of the quill housing against a suitable surface the stator will slide downwards out of the housing. The new stator is then pressed into the housing from below in the same position as the previous one.

Drill Ejector type Tell

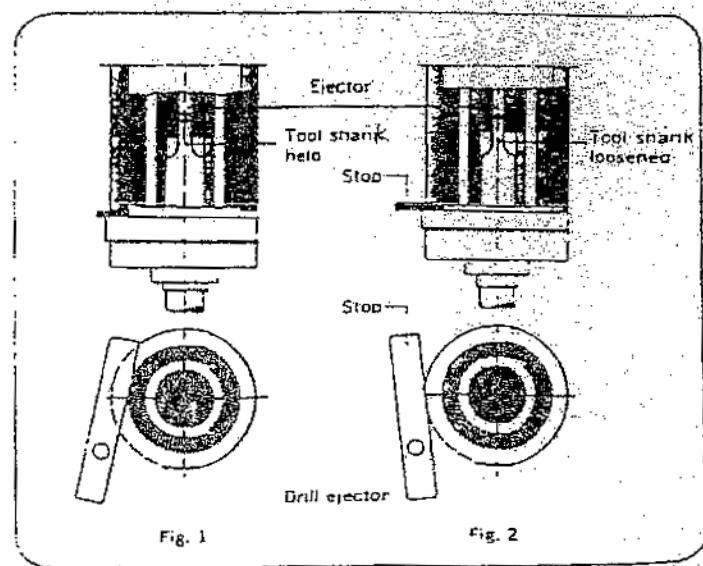

This Drilling Machine is fitted with a built-in Drill Ejector, the mechanism and instructions for use outlined below.

When it is desired to remove a taper shank drill or chuck from the spindle, the pivoting finger stop is swung outward away from the spindle by pressing the short extended section, as shown in figure 2. This allows the quill unit to be raised an extra $\frac{1}{4}$ ". The drill or chuck shank is then ejected from out of the spindle by giving a light jerk on the feed lever. The pivoting finger stop in the "IN" position, as shown in figure 1. Prevents the quill unit from returning completely into quill housing , this preventing the tang on the drill shank from contacting the drill ejector during normal use.

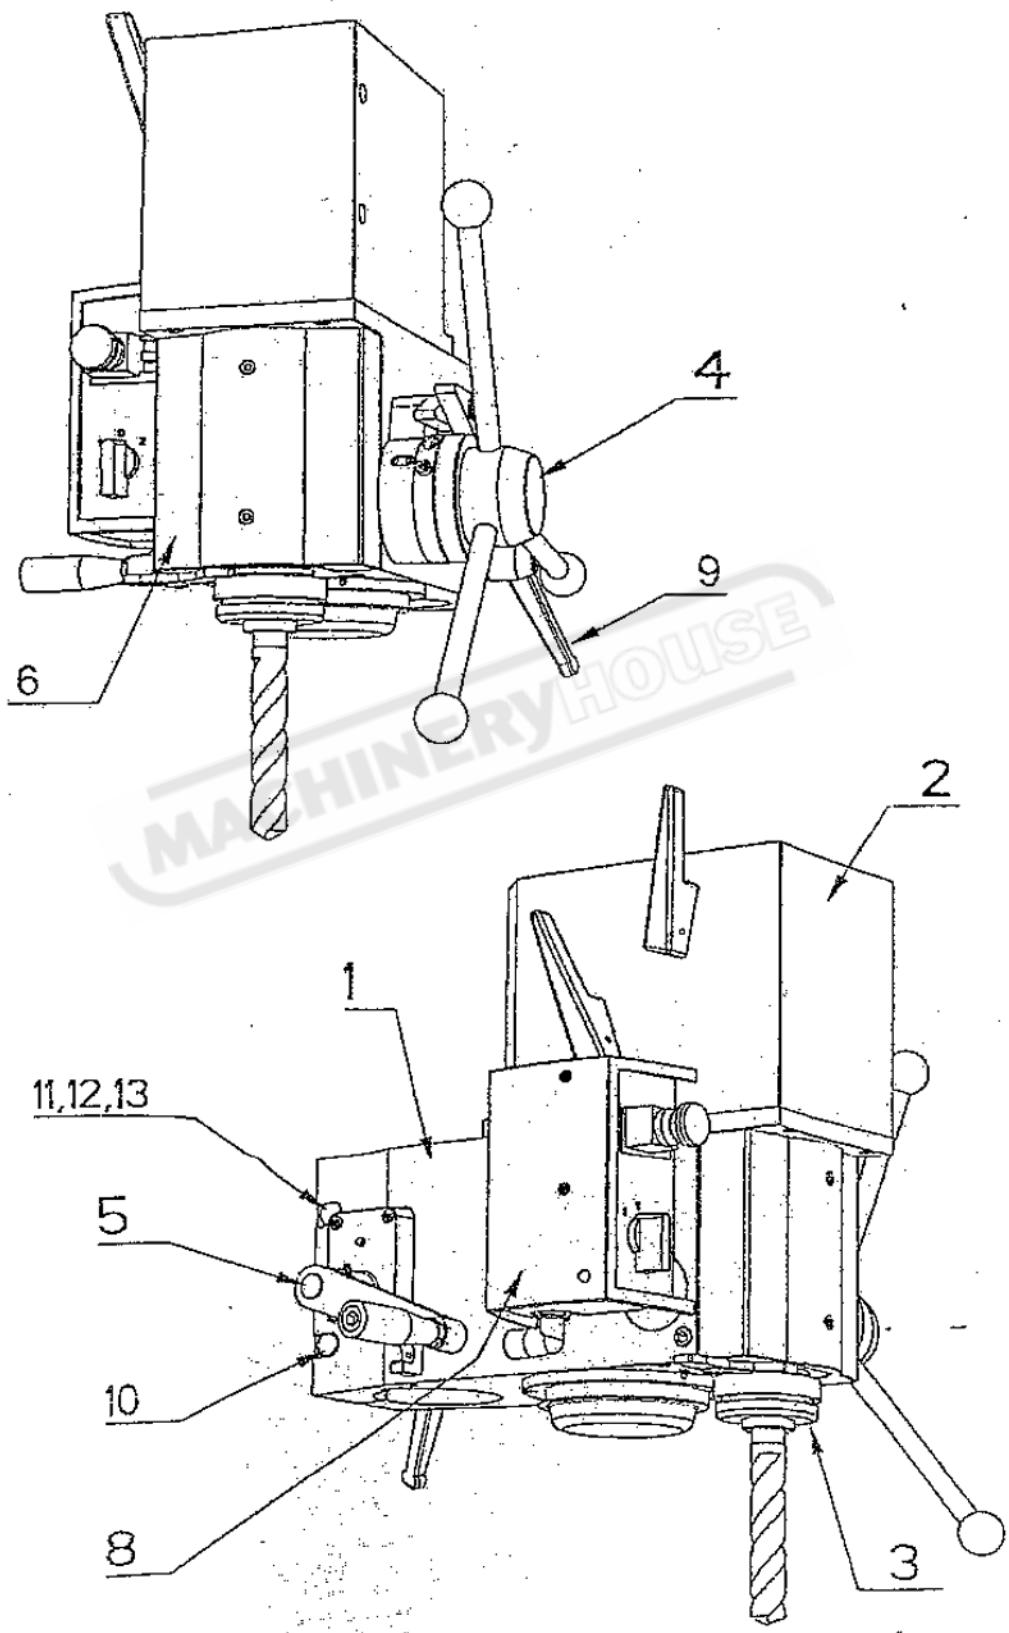

If sometimes occurs that the drill or chuck shank may stick in the taper socket, making it difficult to eject. Do not use force to loosen it, as this may damage both the spindle shaft and the bearings.

In such case use the standard type of drift and when doing so, lower the spindle and quill unit so that the drift slot is below the spindle housing.

It is essential for efficient use of the built-in drill ejector, that drills and chuck shanks are provided with standard tapers and tangs. If the tang is too short the drill can only be removed by using a drift by the aforementioned method. With too long a tang the drill will be removed even if the pivoting finger stop is in the "IN" position. This can, however, be easily remedied by grinding down the head of the tang until it clears the ejector.

PLANT SAFETY PROGRAMME

NEW MACHINERY HAZARD IDENTIFICATION, ASSESSMENT & CONTROL

Stock Code: D170

Description: Geared Head Drilling Machine

Model: GHD-22

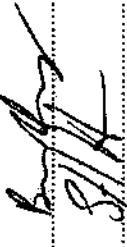

Brand: HAFCO

Developed in Co-operation Between A.W.I.S.A and Australia Chamber of Manufactures
 This program is based upon the Australian Worksafe Standard for Plant(NOHSC:1010-1994)

Item No.	Hazard Identification	Hazard Assessment	Risk Control Strategies	
			(Recommended for Purchase / Buyer / User)	
A	ENTANGLEMENT	HIGH	Eliminate, avoid loose clothing / Long hair etc.	
B	CRUSHING	LOW	Secure & support work material on drill table.	
C	CUTTING, STABBING, PUNCTURING.	MEDIUM	Isolate power to machine prior to any checks or maintenance being carried out. Do not adjust or clean until the machine has fully stopped.	
D	SHEARING	MEDIUM	Isolate power to machine when changing speeds or maintenance is being carried out.	
F	STRIKING	MEDIUM	Make sure all guards are secured shut when machine is on. Ensure workpieces are tightly secured on machine. Wear safety glasses.	
H	ELECTRICAL	MEDIUM	Ensure correct spindle direction when drilling.. All electrical enclosures should only be opened with a tool that is not to be kept with the machine. Never clean or dust machine when power is on.	
M	HIGH TEMPERATURE	LOW	Machine should be installed & checked by a Licensed Electrician.	
O	OTHER HAZARDS, NOISE.	LOW	Wear appropriate protective clothing to prevent hot sweat. Wear hearing protection as required.	
Plant Safety Program to be read in conjunction with manufactures instructions
