OPERATING MANUAL FOR BROBO GROUP MANUAL METAL CUTTING SAWS

TECHNICAL SPECIFICATION

CHAPTER 1: Installation of the Machine

- 1.1 Unpacking and Handling the Machine
- 1.2 Parts Checklist
- 1.3 Minimum Requirements
- 1.4 Anchoring the Saw
- 1.5 Connection to Power Source

CHAPTER 2: Safety and Accident Prevention

- 2.1 Operation of the Machine
 - 2.1.1. Noise Level
 - 2.1.2. Power Supply
- 2.2 General Requirements
- 2.3 Advice for the Operator
- 2.4 Machine Safety Devices
 - 2.4.1. Reference Standards

CHAPTER 3: Main Functions and Operation of the Machine

- 3.1.1. Cutting Head
- 3.1.2. Saw Safety Guard
- 3.1.3. Saw Handle (with 'Dead Man' Trigger Switch)
- 3.1.4. Main power standby & Speed selector switch
- 3.1.5. Manual Vice Clamp
- 3.2 Preparation for Operation
- 3.3 Operation Recommendations

CHAPTER 4: Drawings, Layouts, Assembly and Spare Parts

- 4.1.1 Assembly Drawing (1 of 3)
- 4.1.2 Assembly Drawing (2 of 3)
- 4.1.3 Assembly Drawing (3 of 3)
- 4.2.1 Electrical Circuit 1PH/ 3PH & 3PH Dual Speed Circuit Diagram
- 4.2.2 Electrical Circuit 3PH with Dead Man Trigger (DMT)
- 4.2.3 Diagram For Connection 1PH/3PH Circuit
- 4.2.4 Component Layout & Electrical Schematic Drawings (3PH)
- 4.3.1 Cold Saw Main Dimensions
- 4.3.2 Cold Saw Assembly
- 4.3.3 Standard Gearbox Assembly
- 4.3.4 Deadman Trigger Assembly
- 4.3.5 Standard Manual Vice Assembly
- 4.3.6 Dual Manual Vice Assembly

CHAPTER 5: Adjustments for the Saw Unit

- 5.1 Changing the Blade
- 5.2 Adjusting the Cutting Angle
- 5.3 Cutting and Feeding Speeds
- 5.4 Refilling the Lubricator
- 5.5 Adjusting the **Brobolube** Unit
 - 5.5.1 Lubricating Oil Precautions – Health Hazard Information

CHAPTER 6: Maintenance and Selection of Consumables

- 6.1 Role of the Operator
- 6.2 Maintenance Requirements
- 6.3 General Maintenance of Functioning Components

CHAPTER 7: Troubleshoot

- 7.1 Troubleshooting For Blade and Cutting Problems
- 7.2 General Troubleshooting

APPENDIX

- i. Hazard/Risk Assessment
- ii. Workplace Health & Safety Policy

TECHNICAL SPECIFICATION

STANDARD BLADE SIZES

TABLE 2. Blade Selection Chart

NOTE - CHART GUIDE ONLY

This chart is issued as a **guide only**. Many other factors would attribute to the cutting performance of both the saw blade and the cutting saw machine. BROBO GROUP Pty. Ltd. will not accept any responsibility for the blade selection and/or machine breakages or unsatisfactory cutting performance of both the blade and/or the machine as a direct result of the selection.

Blade Type: AISI M-Z High Speed Steel (62-64 HRC, Hollow Ground)

Blue-oxide coated for:

- Greater durability,
- Better coolant conveyance to the cutting edge,
- Reduces galling or "pick-up" on sides of the blade,
- Reduces brittleness of the steel.

Tooth Form: Bevelled on alternate sides - up to 180 teeth, or
High-rolling, low-finishing teeth, "triple-chip" - above 180 teeth

Drive Pin Holes (Qty. × Ø × PCD): *S315 & S350 Series* 2 × 8mm × 55mm
S400 Series 2 × 10.5mm × 64mm

Worm Gear Drive Ratio (S315/S350/S400): 1:33 Reduction
Sound Level (dBA): 85 - 90 dB(A) Maximum

MOTOR SPECIFICATIONS

Motor Type (Hz)	Phase	Voltage (V)	RPM	Kilowatt (kW)
50Hz Power Supply	1	240	1430	1.7
50Hz Power Supply	3	415	1420 / 2680	1.5 / 2.2
50Hz Power Supply	3	415	650 / 1350	1.1 / 1.5

TABLE 7. Saw Weight

CHAPTER 1 - Installation of the Machine

1.1. Unpacking and Handling the Machine

WARNING - HEAD HEAVY MACHINES

The metal sawing machines are heaviest where the saw heads are fitted and as such, care must be taken while relocating or moving the machines.

Upon receiving the **Brobo Group S315/S350/S400 Series Metal Cutting Saw**, the machine should be standing upright and positioned centrally on top of a wooden pallet. While the machine is situated on the pallet, position the forklift arms under the pallet between the runners, keeping in mind that the machine is **head heavy**. Move the entire unit to an accessible area as close as possible to the final location.

Carefully remove the wooden frame surrounding the saw unit (Figure 1). Once completed, proceed by elevating the machine away from the pallet base using a sling harness wrapped around the cutting head of the saw. Ensure that the floor is as level as possible before finally positioning the machine to the desired location.

FIGURE 1. Handling of Metal Cutting Saw Unit

PLEASE OBSERVE AND FOLLOW THE INSTALLATION INSTRUCTIONS ON PAGE 7

1.2. Parts Checklist

Along with the saw unit, check that the following accessories, packed "loose", are included as follows:

A. STANDARD ACCESSORIES

- 1) 1 × Saw Blade
- 2) 1 × Operating Handle
- 3) 1 × Service Kit (Hexagon wrenches 5", 10" & 14")
- 4) 1 × Operating Manual

B. OPTIONAL ACCESSORIES

Part Number	Description
9311270	Standard Adjustable Length Stop (600mm)
9501450 9501470	'Robo-Rule' Series Manual Micro-Adjustment Length Stop <ul style="list-style-type: none"> ▪ Available in 3.0m or 6.0m lengths ▪ Field Kit includes rail, tape, micro-stop and extension arm.
9501210	Roller Conveyor <ul style="list-style-type: none"> ▪ 68 Kg Steel Rollers ▪ 3000mm x 305mm ▪ 150mm pitch
9311060	Manual Mechanical Vice Clamp
9301950	Manual Mechanical Dual Arm Vice Clamp
9501740	Fabricated Sheet Metal Stand
9301450	Floor Stand, Angle Iron
9301400	Trigger 'Deadman' Switch
9501640	S350D & S400B Brobolube
-	Additional Blade(s) - <i>Custom to Client Requirements</i>

1.3. Minimum Requirements

For the machine to function correctly, the room in which the saw unit is to be installed must be in the vicinity of, and satisfy the following conditions:

- *415/240V Power Supply*
- *Ambient Temperature - From -10°C to +50°C.*
- *Relative Humidity: Not more than 90%.*
- *Lighting: More than 500 LUX.*

WARNING – OPERATING VOLTAGE VARIATION

Each saw model has an inbuilt safety system to protect it against voltage variations. However, for the machine to perform efficiently, ensure that the saw unit operates within ±10% limits of the recommended voltage of the motor.

1.4. Anchoring the Saw

Prior to anchoring the saw unit, take into considerations the requirements mentioned in *Section 1.3* and *Section 2.2*, and other aspects regarding the usage of the machine such as accessibility to cut parts and safe access for the operator.

The base of fabricated stand (if applicable), in which the saw head rests on, is anchored to the floor by 4 × M12 bolts provided. For added stability, it is strongly recommended that the machine stand be fastened to the floor by using loxins (not provided). When positioning and fastening the unit, please refer to the hole locations shown in *Figure 2*.

Figure 2. Anchoring Hole Locations

1.5. Connection to Power Source

Before connecting the machine to the power supply, check that the socket is not connected in series with other machines. This condition is critical for the ideal operation of the saw unit.

Single and Three Phase

- a) **Single phase machines** are provided with three pins, **15 amps** rated plugs and leads for connection to **240V, 50Hz** power supply in **Australia**.

Figure 3.1 Connection 3 pins – 1 Phase

- b) **Three phase machines** should be fitted with a suitable, approved **four pin plugs** (i.e. three phase and earthing - **not provided**)

Figure 3.2 Connection for "4-CORE" Wire System with Neutral – 3 Phase

- c) Check the power supplied and motor specifications before plugging in the machine. Check terminal connection on dual voltage motor terminal box and connect it accordingly to the corresponding voltage supply.
- d) If dual motor is requested, the motor is **always** connected to the higher voltage, unless otherwise specified prior to order being placed.

To connect the machine to the power supply, proceed as follows:

- 1) Insert the power plug into the socket, while ensuring that the **mains voltage is compatible** for which the saw unit is operating at.
- 2) Switch the saw on by rotating the control switch located on the saw head assembly as shown in *Figure 4* below.

Figure 4. *Main Control Switch*

- 3) Check that the motor is operating in the correct direction, that is the blade is rotating downwards and into the direction of the vice clamps.
- 4) Ensure that all electrical leads and cables (including supply leads) are maintained in a good condition and away from sharp objects. All leads should be replaced if cut, sliced or damaged in any way.

Brobo Group S315/S350/S400 Series Metal Cutting Saw is now ready for use.

Chapter 3 provides a detailed description of the various features of the saw and its operating cycles

CHAPTER 2 - Safety and Accident Prevention

The **Brobo Group S315/S350/S400 Series Metal Cutting Saw** has been designed and manufactured in accordance to **Australian Standards**. It is **HIGHLY RECOMMENDED** that the instructions and warnings contained in this chapter be carefully followed for correct usage of the machine.

2.1. Operation of the Machine

The **BW S315/S350/S400 Series Metal Cutting Saw** is specifically design to cut ferrous and non-ferrous metal cross sections with solid or thin-walled profiles. Other types of material and machining are not compatible for use with the specifications of the saw. ***This machine involves a high-speed blade rotation; therefore extreme caution is required when operating the device.***

The employer is responsible for instructing the personnel who, in turn, are obliged to inform the operator of any accident risks, safety devices, noise emission and accident prevention regulations provided for by national and international laws governing the use of the machine. ***The operator must be fully aware of the position and functions of all the machine's controls.***

All those concerned must strictly adhere to ALL instructions, warnings and accident prevention standards in this manual.

The following definitions are those provided for by the **EEC DIRECTIVE ON MACHINERY No. 98/37/CE**:

- **Danger Zone** - any zone in and/or around a machine in which the presence of a person constitutes a risk for the safety and health of that person.
- **Person Exposed** - any person finding him or herself, either completely or partly in a danger zone.
- **Operator** - the person or persons given the responsibility of installing, operating, adjusting, maintaining, cleaning, repairing, and transporting the machine.

WARNING - UNAUTHORISED MODIFICATIONS/REPLACEMENTS/USE

The manufacturer declines any responsibility whatsoever, either civil or criminal, in the case of unauthorised interference or replacement of one or more parts or assemblies on the machine, or if accessories, tools and consumable materials used are different from those recommended by the manufacturer, or if the machine is inserted in a plant system and its proper function is altered.

2.1.1. Noise Level

The noise level of an idling metal saw, fitted with a **180-tooth blade** (supplied as standard by **Brobo Group**) has been measured to be **below 85 dBA**. This complies with the **Australian Occupational Health and Safety (Noise) Regulations 1992**.

Please note that peak impulse noise levels will be experienced due to variables including blade characteristics, type, and condition. This will also vary accordingly depending on the size and type of sample being cut. Under these circumstances, management should make available to the operator(s) the appropriate hearing protection equipment as prescribed under the above stated act.

2.1.2. Power Supply

The 415/240V power supply requirements for this machine are of a high level and unauthorised interference and or inadequate maintenance could result in a situation that could put the operator at risk. A **qualified** electrical engineer should always be assigned to maintain and repair the system.

2.1.3. Compressed Air Supply

Various functions of the saw are carried out via the use of 6kPa compressed air. During these operations, situations would arise where machine parts and materials are clamped together and would potentially pose a serious safety issue to an inexperienced operator. Operators should be thoroughly instructed about these hazards.

Only a qualified electrician should carry out regular maintenance of this system.

2.2. General Requirements

Lighting

Insufficient lighting during the operation of the saw unit would constitute a safety hazard for the people concerned. For this reason, the user of the machine must provide adequate lighting in the working area to eliminate areas in shadow, whilst also preventing dazzling illumination sources

(Reference standard **ISO 8995 - 2002 'Lighting of Indoor Workplaces'**).

Connection

Check that the power supply cables, compressed air supply (if applicable) and coolant system complies with, and are operating within the acceptable range of the saw capabilities.

Faulty, damaged or worn components must be replaced immediately.

Earthing Systems

The installation of the earthing system must comply with the requirements stated in the:

IEC Standards Part 195: Earthing and Protection Against Electric Shocks 1998.

Position of the Operator

The user controlling the machine saw operations must be positioned as shown in the *figure 5* below.

Figure 5. Correct Position for Operating Saw Unit

2.3. Advice for the Operator

Protective eyewear or goggles must be worn at all times while attending and operating the metal saw.

Do not attempt to operate the machine unless all safety guards are in operation.
The guard must fully cover the blade when the head is in the uppermost position.

Ensure that **hands and arms are kept clear of the cutting zone** when the machine is operating.

Do not wear loose clothing with long sleeves and oversize gloves, bracelets, necklaces or any other loose object that may become entangled in the machine's blade during cutting. Long hair must be tied back or placed in a hair net.

Always disconnect the power supply to the machine before carrying out any maintenance work or adjustments. This includes cases of abnormal operations of the machine.

Any maintenance work performed on the hydraulic, pneumatic or coolant systems must be carried out only after the pressure in the system has been released.

The operator **MUST NOT** conduct any risky operations or those not required for the cutting in course (e.g. remove swarf shavings from the machine while cutting).
Never move the saw while the machine is operating.

Always keep the workplace as clean as possible.
Remove equipment, tools or any other objects from the cutting zone.

Support the work piece on both sides of the machine to prevent it falling or jamming during the cutting cycle.

Ensure that the specimen being cut is secured firmly in the vice clamps and the machine has been correctly set. *Figure 7* show some examples on how to correctly clamp different specimen profiles. Before commencing the cut, be sure the vice(s) is securely clamped and the machine set-up is correct.

Figure 7. Correct Clamping of Cutting Specimens

Do not use cutting blades of different sizes to those recommended to the machine's specifications. Always follow safe practices and inspection procedures when installing blades (Please refer to section 5.1 *Changing the Blade*).

When cutting very small specimens, **ensure that the workpiece is not dragged behind the back fence support**, where it could get lodged behind the blade.

If the blade jams during a cut, activate the emergency stop function immediately. Do not continue forcing the blade through. This could damage the blade, the specimen or be a cause for potential injury to the operator.

Always turn off the machine before carrying out any repair work. Consult the **Brobo Group** Engineering Department in the country in which the machine was initially purchased.

2.4. Machine Safety Devices

This product and maintenance manual is not purely intended as a guide for the usage, operation and maintenance of the saw unit in a strictly production environment; it is instead an instrument to providing information on how to use the machine correctly and safely. The following standards listed in section 2.4.1, which are applicable to the **BW S315/S350/S400 Series Metal Cutting Saw**, are those specified by the EEC Committee that governs safety of machinery, health and safety at work, personal protection and safeguarding of the work environment. In addition, the saw also complies with the Australian Standards regarding the safeguarding and general requirements for electrical equipment.

2.4.1. Reference Standards

MACHINE SAFETY

- *EEC Directive No. 98/37/CE - Machines Directive*
- *EEC Directive No. 91/368 - 94/68 - Amends sections of EEC Directive No. 98/37/CE relating to machine safety*
- *EEC Directive No. 73/23 - Low Voltage Directive*
- *AS4024.1 - 1996 - Safeguarding of Machinery*

HEALTH AND SAFETY AT WORK

- *AS3100 - 2002 - General Requirements for Electrical Equipment*
- *OH. & S. 1995.81/1995 - Compliance References*
- *EEC Directive No. 80/1107; 83/477; 86/188; 88/188; 88/642 - Protection of workers against risks caused by exposure to physical, chemical and biological agents in workplace*
- *EEC Directive No. 73/23 and Special EEC Directives No. 89/654; 89/655 - Improvements in health and safety at work*

CHAPTER 3 - Main Functions and Operation of the Machine

3.1.1. Cutting Head

As the name suggests, the cutting head is the focal area where most of the specimen cutting takes place. Thus, correct saw blade selection such as size, number of teeth and tooth pitch are all critical factors that determines the overall performance and quality of the final cuts. In addition, the use of correct saw blade provides minimum burr to the work piece while maximising the safety to the operator during each cutting procedure.

3.1.2. Saw Safety Guard

The primary purpose of the saw safety guard is to protect the user from the spinning blade. It also functions as a safety device to protect the operator from any broken tooth, swarf or high-velocity particles that might be dislodged by the cutting process.

Figure 6. Saw Safety Guard

3.1.3. Saw Handle (with 'Dead Man' Trigger Switch)

Although comes as a standard, the saw handle can be installed with a Dead Man' type trigger switch enabled instant switching at the operators control. This particular configuration allows for increased efficiency and safety.

Figure 7. Saw Handle with "Dead Man" Trigger Switch

3.1.4. Main Power Standby & Speed Selector Switch

The rotary Main power switch also serves as the speed selector switch. When the speed is selected the saw is set to "STANDBY" mode. The "STANDBY" lamp illuminates to provide a warning to personnel the saw is at the ready. AT any time the "Dead Man" trigger is activated the saw will run.

Figure 8. Standby Lamp

3.1.5. Manual Vice Clamp

The manual vice clamp lever allows speedy clamping of material with ergonomically designed clamp lock.

Figure 9. Manual Vice Clamp

3.2. Preparation for Operation

The following procedure is recommended for the correct cutting using the **BW S315/S350/S400 Series Metal Cutting Saw**.

WARNING - SAFETY GEAR

Protective clothing, safety glasses and gloves should **always** be worn while loading parts, operating the machine, or undertaking any maintenance work on the saw.

PROCEDURE

Using a non-flammable and toxic free solvent, clean the machine to remove any corrosion protective coating prior to use.

- 1) Ensure that both the air and electric power systems are turned on, where applicable. The electrical power source must be available before any pneumatic functions will operate.
- 2) To adjust the angle of the cutting surface, if necessary, loosen the 4 bolts, as shown in *Figure 10*. Fine-tune the angle required, then replace and re-tighten the 4 bolts.
- 3) Place the cutting specimen you wish to cut into the vice clamps. Manually adjust the clamps so that the jaws are clamped firmly to the workpiece. With a pneumatic vice, manually adjust the clamps to a clearance of **3 - 7mm**. (For correct clamping of material, please refer to *section 2.3 Advice for the Operator*). **NOTE** -The vice clamps advance with an approximate **10mm pneumatic stroke** to apply a clamping pressure of 6 bar (87 psi).
- 4) Position the vice clamps and component as close to the blade as possible without interfering with the travel of the blade or guard. Vice relocation is required whenever the head angle is altered.
- 5) For pneumatic vices, set the vice clamping pressure from the pressure regulators located on the main control unit door. *If for any reason this pressure is not available on a continuous basis, the regulator on the air service unit must be set slightly below the available line pressure, and the safety low-pressure indicator valve needs to be reset to correspond with the new available pressure. The need to change the pressure is necessary to allow for lighter materials with hollow cross sections to be cut without deforming the walls thicknesses.*
- 6) To initiate the cutting process, either turn the switch to **1** or **2** settings, or press the **START** buttons.
 - Vice jaws automatically close and applies clamping pressure.
 - Position blade to commence cutting through component and maintaining a constant forward feed cutting rate until the end of the stroke.
 - Return saw cutting head to the initial rest position.
 - Vice clamps release workpiece
- 7) Machine is ready for the next cutting cycle.

Figure 10. Angular Adjustment Bolts

WARNING - BLADE JAMMING

If the saw blade jams during a cut, engage the **EMERGENCY STOP** immediately. Remove the part, check that the blade is not damage and if need be, replace the blade.

3.3. Operation Recommendations

- Select the correct saw blade with the correct tooth pitch and form to suit the material to be cut to provide minimum burr and maximum blade lifespan.
- Use the smallest diameter blade and coarsest pitch that is practical within the required speed and material limitations.
- Generally use a tooth pitch to give 2 - 4 teeth engagement with the material during cutting.
- Ensure that sufficient coolant is flowing over the cutting teeth.
- Do not allow the machine's gearbox to run idle in the upright position for more than **3 minutes** otherwise, damage can occur to the drive system.
- The rate of feed affects the quality of the final cut and blade life. This varies also by the material and cross-sectional dimensions. When cutting stainless steel or high carbon steel (**Brinell hardness above 200**), the slowest speed machine should be used together with a cobalt type high speed steel blade.
- When manually feeding the saw head, keep in mind to maintain a steady, continuous pressure, thus **avoiding work hardening** on the cutting piece. Avoid 'forcing' the blade through the material as this might damage or break the blade.
- As a rule of thumb **the softer the component, the faster the rate of speed**. Thus, it is recommended that slower speeds be used for hard and tough materials and higher speeds for soft, ductile materials. Note that for non-ferrous materials such as brass, copper, aluminium etc. require much faster speeds than provided on this machine. If these are the majority of materials cut, a **Brobo NF Series** machine should be considered.

SHEET 1 OF 1

CHAPTER 5 - Adjustments for the Saw Unit

5.1. Changing the Blade

To replace a worn saw blade:

DANGER – ELECTROCUTION

Make certain that the power to the manual saw is turned off before proceeding with changing the saw blade.

- 1) Disengage the linkage arm that is between the guard linkage system and pivot block (at the pivot block by compressing the spring and moving the bolt through the slot).
- 2) Slide the saw guard up as far as possible (as if it was opening during a cutting cycle) to gain access to the spindle nose.
- 3) Loosen the spindle screws (LH thread), using the 14mm hexagonal wrench provided, and remove the counter plate. To loosen the spindle screw, insert the wrench (short end) into the socket head cap screw and firmly knock the wrench with the palm of your hands until the screw is loosened. If this method fails to free the screw, place a piece of timber under the blade of the machine, and loosen (or tighten) the screw while holding the saw head of the machine down (blade against the timber).
- 4) Remove the worn saw blade away from the spindle hub. Using a soft brush, clean the face of the spindle, counter plate and mounting faces of the blade of any dirt or swarf that was trapped by the previous cutting cycles.
- 5) Place the old saw blade into the new blade packaging and disposed of it safely. Carefully mount the new blade onto the spindle hub, ensuring that the blade is rotating into and towards the back fence, and replace the counter plate utilising the drive pins as guides as it passes through the pinholes on the blade.
- 6) Rotate blade back against the drive pins in a **counter-clockwise** and finger tighten the spindle screw.
- 7) Firmly retighten the spindle screws, ensuring that the saw blade spins uniformly and aligned parallel with the safety guard.
- 8) Lower the outer guards and make certain the pin of the linkage arm is re-engaged with the track on the inner guard and reconnect the guard linkage.
- 9) The new blade is ready for use. To check that the blade is performing correctly, carry out a sample cut on a piece of off-cut.
- 10) If optional devices are supplied, mount the stock support and rollers on either side of the clamping table. Normally stock should feed from **left to right**, but it can be feed from the **right to left**, if required.

5.2. Adjusting the Cutting Angle

The back jaw wear plates on the **Brobo Group S315/S350/S400 Series Metal Cutting Saw** are typically fitted in the following manner. For angular cutting, the wear plates should be repositioned to provide the maximum support on one side and clearance on the other (*Figure 11*).

Figure 11. Angular Cut Positions

- i. To adjust the angle of the cutting surface, loosen the socket head screws shown in Figure 10, located on **the back jaw face that clamps the table**, using the hexagonal wrench provided.
- ii. Fine-tune the angle required. The shot-pins have positive locations at 90° and 45° right and left. Adjust the angle on the back fence to suit.
- iii. Re-tighten all the previously loosen socket head screws. The saw is now ready for use.

Cutting and Feeding Speeds

As previously highlights, the rate of feed largely affects the quality of the final cut. As such, the blade life is also dependent on the feed at which it is cutting the sample material - in particular, the type of material and also the cross sectional dimensions. Thus, to extend the life of the blade, maintain a firm and steady pressure whilst allowing the blade teeth to cut at an optimum rate. **Do not force the blade through the material!** This could cause numerous problems including breaking the blade teeth, jamming the blade with the cutting part or fracturing the blade spindle.

The cutting action also generates a large amount of heat within the cutting sample due to frictional contact. Should this heat affect the material you are cutting in any way, the heat should be dissipated using the coolant system.

5.3. Refilling the Lubricator

To refill the lubricator bowl, twist the bowl anti-clockwise and slide it down to detach it from the lubricator unit (There is no need to disconnect the air supply to the unit). The unit can now be refilled to the line positioned near the top of the bowl, which is approximately 10 millimetres from the top edge of the bowl. **Do not fill the bowl above this line**, as the lubricator unit will not function properly.

Replace the lubricator bowl in the reverse manner by sliding the bowl upwards, ensuring that the feed tube is located inside the bowl, and twist it clockwise to lock it into position.

5.4. Adjusting the Brobolube Unit

When assembled, the Brobolube unit is a precise instrument that supplies an accurate quantity of lubricant directly to the saw blade before it contacts the work piece. There are 2 control variables available for the operator:

Air Flow (Volume) Delivery

Regulated with the tap (needle valve), this can be adjusted from initial, completely closed to fully open states. It is highly recommended that the upper end of the flow range be utilised to allow an adequate airflow to deposit and evenly distributed the lubricant onto the blade, while maintaining a fine lubricant mix. If the needle valve is not open sufficiently, the air to lubricant ratio may vary, and may result in a substandard distribution of lubricant to reach the blade teeth.

Lubricator Flow Rate

This controls the fluid flow rate and is adjustable via the slotted needle valve situated on top of the lubricator. The consumption of Brobolube is factory set to **4 drops per minute**. This has been examined to produce a sufficient mix of air and lubricant, and it is recommended to use this initial setting. On this setting, approximately **55 cubic centimetres** (lubricator capacity) should last for **20 hours of continual cutting**. If for some reason the setting needs to be altered, the needle valve should be turned clockwise to reduce or anti-clockwise to increase the fluid flow respectively.

NOTE

- i. Although the lubricator is capable of delivering a much higher flow rate of lubricant, it is suggested that you do not increase the flow rate excessively because:
 - No significant increase in blade life or lubricating efficiency will be achieved (confirmed by test results).
 - Excessive application of Brobolube will only result in a waste of fluid.
 - Excessive application will produce swarf that will be wet (oily) and harder to clean up than dry swarf produced from the correct supply of Brobolube.
- ii. The amount of Lubricant (when set correctly) delivered by the lubricator is not easily visible by the naked eye. If in doubt that lubricant is being delivered, first check to see if lubricator itself is delivering droplets at its sight glass. If still unsure whether lubricant is being delivered, disconnect the supply tubing to the tap (needle valve) and hold the tube against some blotting paper for a few seconds while the lubricator is operating.

5.4.1. Lubricating Oil Precautions - Health Hazard Information

The Brobolube lubricating fluid has no known adverse health effects. "Brobolube" is non-toxic, odourless, non-flammable below approximately 350°C, and non-corrosive, although it may affect some types of rubber. There are no traces of sulphur, chlorine, phenol or nitrates found in Brobolube. When comes into contact with skin, the oil may be removed by wiping away the excess, then washing the contaminated area with detergent and water. If the oil is utilised at high temperatures, appropriate protective apparel should be worn as the oil could cause burns to skin or eyes. If splashed by hot oil, immediately run cold water over the burn area and apply first aid burn treatment.

If the Brobolube delivery line breaks or becomes disconnected during operation, ensure that the air supply to the system is disconnected before repairing the problem.

It is recommended that footwear with anti-slip soles be worn at all times. Any spills will result in potentially hazardous slippery surfaces and should be dealt with promptly to prevent physical injury resulting from falls. Do not use coarsely, combustible material like sawdust to soak up oil due to the potential risk of spontaneous combustion. Spilled oil should be transferred into non-porous containers of suitable strength. Any remaining oil should be cleaned up with sand or other non-combustible, absorbent material. Place the sand and oil mixture into containers and disposed of by an EPA approved landfill or alternatively, by a suitable non-polluting method.

In addition, rags soaked in oil should not be burned. Do not pour oil down the drain, which would ultimately contaminate the water supply and pollute the environment.

For firefighting purposes, either use CO₂, dry chemical or foam retardant to extinguish the flames.

CHAPTER 6 – Maintenance and Selection of Consumables

6.1. Role of the Operator

The person operating and maintaining the **Brobo Group S315/S350/S400 Series Metal Cutting Saw** must familiarise themselves with these instructions for their own safety and that of the others, in addition to safeguarding the production of the machine. Responsibility must be taken by the user on the general maintenance and up keeping of the unit as specified in this chapter, with particular emphasis on:

- Check to ensure that other operators of the machine always aware of and comply with the relevant safety instructions and standards as specified in *Chapter 2 - Safety and Accident Prevention*. Therefore, check that the safety devices are operational and work perfectly and that personal safety requirements are complied with.
- Ensure that the working cycle is efficient and guarantees maximum productivity, inspect the:
 - Functions of the main components of the machine
 - Sharpness of the blade and coolant flow
 - Correct working parameters for the type of material being cut
- Verify that the quality of the cut meets the requirements and that the final product is free from any machining defects.

6.2. Maintenance Requirements

- All maintenance must be carried out with the power switched off and the machine in emergency stop condition.
- To guarantee for optimum operation, all spare parts must be **Brobo Group** originals.
- On completion of maintenance works, ensure that the replaced parts or any tools used have been removed from the machines before starting it up.
- Any behaviour not in accordance with the instructions for using the machine specified in this manual may create hazards and/or safety risks for the operator.
- Therefore, read and follow all the instructions for use and maintenance of the machine and those on the product itself.

6.3. General Maintenance of Functioning Components

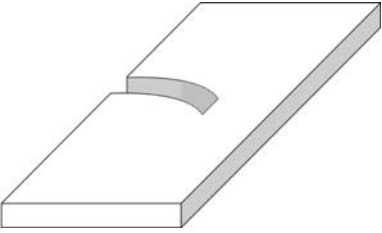

The general maintenance operations that should be carried out regularly are as follows:

- 1) Keep the vice clamps, overall machine and path of the cutting blade free of any offcuts, accumulated swarf and coolant using compressed air or preferably thread-free cloth.
- 2) Observe the oil level on the gearbox. The first oil change should be performed after the initial **60 hours of operation** and **500 hours of operation** thereafter. Use extreme pressure industrial gear oil - ISO VG 220 viscosity, conforming to AGMA 5EP, US Steel 224 or API GL-2 specifications to which 3% colloidal molybdenum disulphide has been added. Refilling point is situated in the handle bar mounting threaded hole. The required quantity to refill is approximately 800 ml for the S315/S350/400 gearboxes. Gearbox oil is available from **BROBO GROUP** Pty. Ltd. in 2 Litre packs (Part No. **9501090**).

- 3) Change coolant as required, or whenever the coolant starts to get dirty or emits a stale odour. The coolant compensation tank should be checked regularly. Coolant level would expect to naturally decrease over time due to natural evaporation. Use premium quality coolants such as CoolTech 500 or SlideTech 68. Coolant is available from **BROBO GROUP** Pty. Ltd. in 2 litre & 20 litre packs (Part No. **9301570** & **9501080**): Concentrate, Ratio 1:20
- 4) Lubricate the saw head pivot shaft and rotary table regularly (after every 40 hours of operation, or weekly) with an NLGI 2 extreme pressure grease, Shell Alvania No.1 grease or equivalent.
- 5) Clean the vice and lubricate any moving joints or sliding surfaces with good quality oil.
- 6) Clean the machine regularly and keep any unpainted surfaces lightly oiled to protect from rust and corrosion.
- 7) The air supply for the pneumatic air vices should be checked regularly such that it is free of any condensed water molecules and the filter should be drained frequently.
- 8) Ensure that the machine performs cuts perpendicular to the work surface.
If not, contact **Robo Group** engineering department.
- 9) Test that the blade is at right angles to the workpiece back fence.
If not, contact **Robo Group** engineering department.
- 10) Check that the 0° notch on the fixed worktable is aligned with the gradation on the turntable. If not, adjust as described in Section 5.2.
- 11) Examined that the precision of the 15°, 30°, 45° left and right stops are correct and accurate. If they are not adjusted properly, proceed as described in Section 5.2.
- 12) Regularly empty out the swarf catcher, resting directly above the compensation tank, of any offcuts and swarf that has collected during the numerous cutting cycles.

CHAPTER 7 - Troubleshoot

7.1. Troubleshooting For Blade and Cutting Problems

<u>PROBLEM IDENTIFIED</u>	<u>DIAGNOSIS</u>	<u>SOLUTIONS</u>
<p>Cuts produced are not at 90° and/or are not perpendicular</p> 	Head speed too low or too high	Reduce or increase head speed respectively.
	Blade with worn teeth	Replace with new blade, with reference to <i>Section 5.1 Changing the Blade</i> .
	Angularity of blade to workpiece back fence and vice clamps	Adjust the position of the blade so that it is at right angles to the workpiece back fence using the 0° notch as reference; set the stops at 45° left and right using the method described in <i>Section 5.2 Adjusting the Cutting Angle</i> .
	Blade not perpendicular to work surface	Adjust the blade using the appropriate screws such that it is perpendicular to the work surface.
<p>Frequent and/or excessive teeth breaking</p> 	Broken teeth	Check the hardness of the material being cut corresponds within the capabilities of the blade.
	Incorrect lubricant/coolant fluid	Check the water and oil mixture; check that the holes and/or hose are not blocked; direct the nozzles correctly; check that the lubricant/coolant fluid conforms to those specified in <i>Section 6.3 General Maintenance of Function Components</i> .
	Material too hard	Check the cutting speed, feed speed, blade type and parameters are correct for the particular application.
	Blade not worn in correctly	With a new blade, it is necessary to start cutting at <i>half feeding speed</i> . After a normalising period (cutting surface about 300cm ² for hard materials and 1000cm ² for softer materials), both cutting and feed speeds can be brought up to normal values.

Blade with incorrect and/or excessive fine tooth pitch

As excessive pressure is exerted of the incorrect teeth profile, replace the blade with correct tooth pitch dimensions and profile.

Workpiece not clamped firmly in place

Any movement of the workpiece during the cutting process can cause broken teeth; check the vice clamps, clamping jaws and clamping pressure is satisfactory.

Excessive vibrations

Specimen vibrates in the vice; check that the vice clamps are position correctly and the clamping pressure are adequate.

Rapid teeth wear

Head speed too slow or too high

The blade/slide runs over the material without cutting it; increase or decrease head speed respectively.

Cutting pressure too high

Reduce cutting pressure

Insufficient coolant

Check the coolant level and clean piping and nozzles

Non-homogenous material being cut

The material present may not be homogenous either on the surface, such as oxides or sand present, or in sections, such as under-cooled inclusions. The variances in grain development cause the premature wearing of teeth and consequently, break as the result. Homogenise or clean these materials.

Broken blade

Head speed too high

Reduce head speed

Teeth in contact with material before commencing the cut

Always check the position of the blade before starting a initiating a new cut or job

Insufficient coolant

Check the coolant level and clean piping and nozzles

Excessive vibrations

Specimen vibrates in the vice; check that the vice clamps are position correctly and the clamping pressures are adequate

7.2. General Troubleshooting

Below lists of some of the most commonly identified problems associated with the **BW S315/S350/S400 Series Metal Cutting Saw** and the recommended troubleshooting procedures to undertake to rectify the situations. If the solutions provided do not resolve the problem, or the problem identified differs from those listed, **immediately** contact **Brobo Group** engineering department.

<u>PROBLEM IDENTIFIED</u>	<u>DIAGNOSIS</u>	<u>SOLUTIONS</u>
<i>Spindle motor will not rotate</i>	Electrical power supply not connected	Ensure that the main power cable is plugged in and switched on. Check the phases, cables, plugs and sockets for loose connection. Also check that the motor connections are in place.
	Loose contactors	Verify that the contactors are not loose. If contacts are short-circuited, contact Brobo Group engineering department immediately
	Motor burnt out	Check that it has not burnt out, that it turns freely and there is no moisture in the main electrical unit. The winding can be rewound or replaced
	Blown fuses	Examine that the fuses are intact and fitted correctly, otherwise replace or tighten the fuse holders
<i>Machine open slowly or not at all</i>	Hydraulic oil level and pressure system	Check for any leaks present within the catchment unit. Top up the with coolant as recommended in <i>Section 6.3 General Maintenance of Functioning Components</i>
<i>Coolant system not operational</i>	Blocked coolant tubing	Check that it is not kinked, severed or blocked. Flush out any blockages

Brobo Pty. Ltd. Dandenong South
Plant Risk Assessment Report

SCOPE

A risk assessment program of plant items was commenced on behalf of Brobo Pty. Ltd. Dandenong South during March 2009. The assessment was commissioned by Mr David Golic. Plant items assessed were located within the manufacturing facility located at 66-68 Williams Rd. Plant assets inspected were as per the Operating Manual for the OHS Series S315, 350, 400 S SCV Metal Cutting Saws, Sn's. C29680~.

As far as practicable, risks have been assessed against relevant Australian Standards, the Code of Practice for Plant No. 19, 1 July 1995. The Risk Assessments are completed under the "Generic" classification as defined by the Code.

METHOD

Hazard

Parts, accessories, components or other items together with the likely use, materials used as part of the process, cleaning procedures and maintenance procedures are some of the items given due consideration as to the likelihood of presenting Health and Safety risks to personnel . These items identified as hazards are described under the heading of "Hazard". *The Hazard listed in column 1 of the Risk Assessment.*

RISK

The level of the Risk associated with each Hazard is based on AS 4360 Risk Management, consistent with Worksafe Victoria guidelines.

The qualitative measures are:

6	Catastrophic (multiple deaths, loss over \$1,000,000)
5	Disaster (single death, loss to \$1,000,000)
4	Very serious (Permanent disability, loss to \$1,000,000)
3	Serious (extensive medical treatment required, lost time >7 days, loss to \$500,000)
2	Substantial (medical treatment, lost time <7 days
1	Minor (first aid treatment, lost time < 1 day)

RISK CATEGORY MATRICES

Consequence: Minor 1		Exposure					
		1 Very Rare	2 Rare	3 Infrequent	4 Occasional	5 Frequent	6 Continuous
Probability	6 Almost Certain	L	L	L	L	M	S
	5 Quite possible	L	L	L	L	L	M
	4 Unusual but possible	L	L	L	L	L	L
	3 Remotely Possible	L	L	L	L	L	L
	2 Conceivable	L	L	L	L	L	L
	1 Practically Impossible	L	L	L	L	L	L

In some instances consideration is given to the possibility that, due to circumstances, there is a possibility that a “minor” incident, due to complications may escalate into a “serious” or even “disasterous” injury.

The Risk level score calculation is shown included in column 3 of the Risk Assessment.

RISK SCORE CALCULATIONS

The risk score is a factored in the following order:

Consequence (1 to 6) 1 being lowest consequence	Probability (1 to 6) 1 being lowest probability	Exposure (1 to 6) 1 being lowest exposure
--	--	--

Below is an example of the method used to calculate the risk scores with the aid of the Matrices.

Sample: Risk Assessment table excerpt.

Hazard	Risk	Score	Control Recommendation	Action Taken Yes / No	Re-Score
Rotating blade in reach of operator at normal work station of shift.	Severing injury risks RISK SCORE: 6:5:4	V			

<ul style="list-style-type: none"> • Consequence Very Serious 4 • (Permanent disability, loss to \$1,000,000) 	<ul style="list-style-type: none"> • Probability Quite Possible 5 Quite possible 	<ul style="list-style-type: none"> • Exposure Frequent 5 Frequent 	<ul style="list-style-type: none"> • Code V
--	--	---	---

The risk score calculation shall be indicated as follows 4:5:5= V

Code	Risk Level	Suggested action
V	Very High	Immediate cessation of work, isolation of area and corrective action required
H	High	Immediate corrective action required
S	Substantial	Should receive attention within specified time
M	Moderate	Should be dealt with within specified time but not an emergency
L	Low	Risk is acceptable

CONTROL RECOMMENDATIONS

The Plant auditors pool from their experience in the particular field to offer the most practical cost effective and readily available Risk controls available to be introduced for each item.

CONTROL STANDARD

Controls are recommended based on minimum standards established in Regulations, Codes and Australian Standards where applicable.

RE-SCORE

The Re-Score column provides an indication of the anticipated extent of the proposed Risk management. This figure is only indicative and can only be ascertained once the actual control is introduced and evaluated and reviewed by a subsequent Risk Assessment.

TERMS OF REFERENCE

The Risk Assessment shall be conducted by a competent assessor; the assessor shall take into account :

- **The actual use of the plant**
- **Constructive comments and input from operators**
- **Appointed employee OHS representative group**
- **State of Knowledge of the type of Plant**
- **Applicable Australian Standards.**

FOLLOW UP

This report has been prepared in an easy to use format. The "Action Taken" column should be completed as each item is addressed. The person responsible should initial the "Ref" column.

All risk controls introduced as a result of this report need to be reviewed for quality and performance depending upon the severity of the risk control. A review schedule must be introduced that will enable management and the responsible people to evaluate the performance and the quality of the controls. They also need to be able to determine if any further risks have been created as a result of the introduced control.

HAZARD, RISK, CONTROL REPORT

Make: Brobo Cold Cut Saw Model: S /SCV 315A/D, 350/D, 400/B

MANUFACTURERS' SERIAL NO GROUP C29680~

HAZARD	RISK	SCORE	CONTROL	ACTION TAKEN Y/N	RE-SCORE
415/240 Volt Main power supply.	Inability to isolate power supply during cleaning or maintenance, injury risk, electric shock, electrocution risk to operator or repair personnel. Failure of circuit protection to activate in the event of metallic frames becoming live. RISK SCORE: 5:4:4	V	Introduce "Plug lockout calliper system" to isolation and "lockout" / "tagout" procedure to site maintenance procedures. Attach site maintenance procedures to site safety induction policy & induction for maintenance personnel. Include item to "Test & Tag" AS / NZS 3760 periodic test register. Carry out insulation leakage tests to all hazardous voltage, mains power electric components and associated metal work. Check earth continuity / resistance to all metal frames and attachments. Provide or repair earth points as necessary in accordance with AS 3000 & AS/NZ 3760		5:2:3=M
415/240 volt power supply.	Electric shocks, burns, electrocution risks. RISK SCORE: 6:5:4	V	Fit "DANGEROUS VOLTAGE," and or ISO international symbol signs to all access covers over dangerous voltage areas of unit. Adequate warning of dangerous voltages within must be provided at all areas.		6:1:2=L
Standby operation of saw.	Accidental operation of saw during servicing, setup or adjustment. Severing, cutting, electrical shock injury risks. RISK SCORE: 4:3:4	M	Fit "STAND BY" warning indicator circuit and tell tale lamp to saw in proximity to "ON / OFF" switch.		4:3:2=L
Plant maintenance.	Unauthorized and untrained personnel carrying out plant maintenance, personnel injuries. Risk Score: 5:4:4	V	Introduce "No unauthorized personnel to carry out maintenance to plant" policy to site induction training.		5:2:2=L

Brobo Pty. Ltd. Dandenong South
Plant Risk Assessment Report

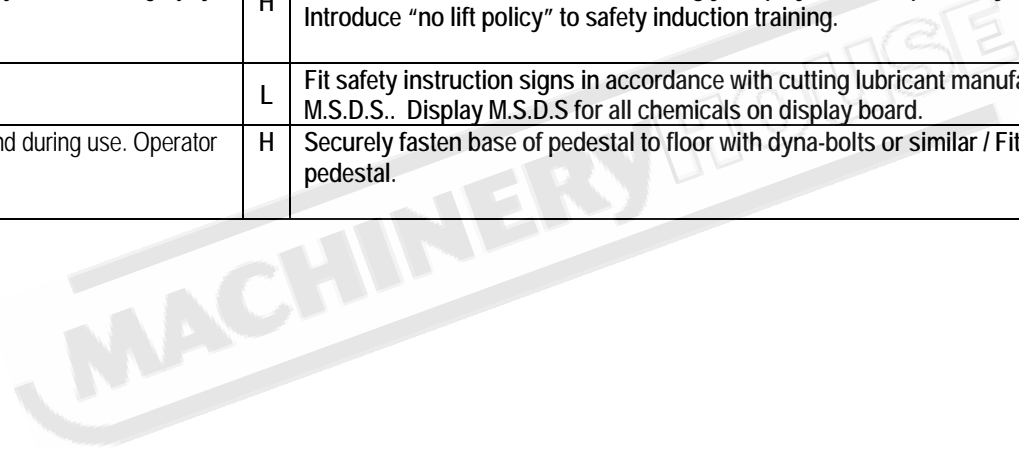

HAZARD	RISK	SCORE	CONTROL	ACTION TAKEN Y / /N	RE- SCORE
Emergency stop system.	In ability of operator to shut down plant in the event of an emergency. Non compliance with Plant regulations and AS 4024. Striking, crushing injury risks. Electric shock risks, electrocutions risks. RISK SCORE: 5:4:4	V	Fit red coloured lock down type mushroom head emergency stop button with identification and operating instruction signs, "PUSH TO STOP" located in the immediate proximity to normal operator work stations. (Operator must be able to activate emergency stop from all control stations and normal work positions. Emergency stop equipment circuitry must be "fail safe" & comply with AS 1543, AS 4024 & AS 3000. The wiring of the emergency stop system must comply with AS 4024.1 Section 6.3.7.1 Alternatively fit foot operated / kick type emergency stop system, and fit identification and function sign.		5:1:3=L
Operation controls.	Accidental operation, incorrect use of plant. Non compliance with Plant regulations and Australian Standards. RISK SCORE: 4:5:5	V	Fit identification, function operating and direction signs to all controls, including function and direction indication ie. "ON / OFF", "SLOW / FAST" in accordance with R 306.1 of the Plant regulations. Signs must be permanent and indelible in accordance with AS 1319.		4:1:2=L
Unauthorised use of plant.	Cutting injuries, eye injuries, severing risks. RISK SCORE: 4:3:4	M	Fit "ONLY TRAINED EMPLOYEES TO OPERATE THIS ITEM OF PLANT AT ANY TIME" place sign in visible location.		4:3:2=L
Flying chip particles and machine debris.	Eye injuries, eye damage. RISK SCORE: 5:5:3	V	Fit eye protection sign to plant unit base frame in location visible to control station, alternatively include. Mandatory eye protection P.P.E requirements to site induction with appropriate signs at entry points to machine shop. Signage must be in accordance with AS 1319 sign No. 421 with supplementary text indicating type of eye protection, ie. Face shield or goggles.		5:1:3=L
Operating noise levels.	Hearing loss due to noise exposure. RISK SCORE: 4:5:5	V	Fit "HEARING PROTECTION MUST BE WORN" sign in proximity to plant. Fit sign in accordance with AS 1319, sign No 425.		4:2:3=L

Brobo Pty. Ltd. Dandenong South
Plant Risk Assessment Report

HAZARD	RISK	SCORE	CONTROL	ACTION TAKEN Y / IN	RE- SCORE
Cleaning.	Crushing, striking injuries to operators, maintenance and cleaning personnel. RISK SCORE: 6:3:5	V	Fit "DANGER HIGH VOLTAGES, QUALIFIED SERVICE PERSONNEL ONLY, SWITCH OFF AND ISOLATE PLANT AT ALL TIMES PRIOR TO CARRYING OUT ADJUSTMENTS OR CLEANING", signs in proximity to controls		6:2:3=S
Airborne contaminants, dust.	Ingress of hazardous materials into lungs, respiratory illness, lung disease. RISK SCORE: 5:3:5	V	Fit "Respirator must be worn", P.P.E. signs in accordance with AS 1319 sign number 423.		5:2:2=L
Safety systems.	Severing, crushing injury risks. RISK SCORE: 5:3:5	H	Create plant log book for each item of plant. Introduce periodic safety inspection system of all electrical, mechanical safety systems, including main power isolator, limit switches, guards, wiring and emergency stop buttons. Record all results in plant log book on a scheduled interval.		5:2:3=M
Hazardous voltage supply cables, lines and equipment.	Opening of incorrect circuits during maintenance, incorrect maintenance, non compliance with industry standards. And building code. Maintenance personnel, operator injury risks. Striking, injuries, eye injuries, burns injuries, electric shock injuries, electrocution injuries. RISK SCORE: 5:5:3	V	Fit identification signs to all hazardous voltage circuits. Fit ISO type colour coded identification and flow direction signs to service lines and pipes in accordance with AS 1345. (All building and plant service lines, plumbing and cabling must be clearly identifiable.)		5:1:3=L
Work piece material.	Material rolling over during cutting, operator injuries, hand injuries, cutting blade breakage. RISK SCORE: 2:4:5	M	Fit "SECURELY CLAMP ALL MATERIAL PRIOR TO CUTTING", sign in proximity to machine.		2:4:3=L
Main saw blade.	Hand injury risks, entanglement, crushing severing risk. RISK SCORE: 3:3:4	M	Fit swing type automatic retract & return safety guard to AS 4024 to saw blade, to prevent finger access to blade when not engaged in cutting of material (saw blade must be completely guarded when in standby, existing guard does not adequately prevent access to saw blade while in standby position).		3:2:4=L

Brobo Pty. Ltd. Dandenong South
Plant Risk Assessment Report

HAZARD	RISK	SCORE	CONTROL	ACTION TAKEN Y / / N	RE- SCORE
Replacement of saw blade.	Hand injury risks, entanglement, crushing severing risk. RISK SCORE: 3:3:4	M	Carry out "Job Safety Audit" on procedure, write "Safe Work Procedure" accordingly, display S.W.P. in proximity to machine.		3:2:4=L
Work piece loading and unloading to saw bench.	Manual handling injury risk. Hand injury risks, muscle strains, back injury risks, crushing injury risks. RISK SCORE: 3:4:5	H	Carry out "Job Safety Audit" on procedure to suit handling of materials onto machine, write "Safe Work Procedure" accordingly, display S.W.P. in proximity to machine. Introduce "no lift policy" to safety induction training.		3:4:5=M
Cutting coolant.	Poisoning, injury risk, RISK SCORE: 3:2:4	L	Fit safety instruction signs in accordance with cutting lubricant manufacturers' M.S.D.S.. Display M.S.D.S for all chemicals on display board.		3:1:4= L
Stability of Saw pedestal / Stand.	Collapse of pedestal/stand during use. Operator injuries, plant damage. RISK SCORE: 4:4:4	H	Securely fasten base of pedestal to floor with dyna-bolts or similar / Fit on suitable pedestal.

Certificate of AS 4024 & AS 3000 compliance

This is to certify

That an AS 4360 Risk Assessment has been completed on the

Brobo S315 A/D, S/SCV 350 D, S/SCV 400/B OHS Series Metal Saws Serial No's. *C29680 ~ (*Subject to limitations)

Risk Control recommendations have been implemented accordingly.

*The Plant system satisfies necessary requirements of the
Occupational Health and Safety Act 2004*

WORKPLACE HEALTH & SAFETY POLICY

SAFETY COMPLIANCE DESIGN EVOLUTION

Brobo Group (Brobo Waldown) has been a leading manufacturer of quality industrial products since 1947.

Our products have been synonymous with the Australian workplace since the beginning.

As Health & Safety standards have improved Nationally, Brobo Group has adopted OH&S design disciplines to drive ongoing development of its products in line with the highest workplace safety standards.

Brobo Group is committed to design and manufacture equipment of the highest quality standard for Australian & International workplaces.

“We are committed to providing Australian workplaces with the safest and most durable high quality tools.”

David Golic
